TYPICAL INSTALLATION DETAIL

NOTE: Concrete around and under trench should be a minimum of 4" thick or the same thickness of the surrounding slab.

1. Assemble the 1 Meter Modular Sections as required. Apply a bead of the supplied Smith Seal Sealant on the end of the channel before bolting the channels together with the supplied hardware.
2. Use the leveling bolts to set the desired elevation.
3. Use a string line to ensure the run is straight and level.
4. Pour small patties of concrete around the leveling bolts to anchor the run.
5. When making the final pour, vibrate the concrete to remove air pockets. Ensure the entire channel is encased in concrete.
6. Slope concrete toward the trench and ensure that the finished level of concrete is 1/8" above lip of trench.

9660-FC

When Specified - FC (Flashing Clamp)

Install the 9660-FC trench drain following steps 1 thru 4. Then attach the membrane to the flashing flange on each side and ends and secure to the 9660 trench drain channel sections, using the flashing clamp and hardware provided. Then complete the final pour as required, see steps 5 and 6. **Note, these instructions are suggested only and may vary / differ based on job site conditions.**

NOTE: Dimensions shown in parentheses are in millimeters.
